

Make strategy load-bearing.

ASHLEY AND FOUNDATION DATA

Foundation Data does not need another layer of status reporting. It needs an operating system that connects Scout, tagging, analytics, marketing, and data work to customer decisions, economics, capacity, trust, and explicit executive choices.

WHY ME

I have repeatedly translated ambiguous strategy into mechanisms teams can use, leaders can trust, and customers can feel - across Amazon operations, AI and optimization work, advanced manufacturing, logistics, product development, and startup scaling.

HOW I WOULD OPERATE

- Earn context before prescribing.
- Build one visible portfolio of outcomes, owners, dependencies, capacity, evidence, and next decisions.
- Attach AI to measurable throughput, quality, margin, and capacity redeployment - not demo activity.
- Protect scarce technical capacity while keeping execution responsive to revenue and customer value.

CLOSE

The role is described as a junior COO. I would treat it accordingly: extend executive intent, reduce cross-functional reconstruction, and create disciplined leverage without building a heavy PMO. I would welcome the opportunity to discuss the Strategy Loadframe and 120-day entry plan.
