

The real mandate

MANDATE

Serve as the COO's execution extension while turning Scout, tagging, analytics, marketing, data, and internal AI into one revenue-governed operating portfolio.

SUCCESS

Leadership sees priorities, dependencies, forecast confidence, capacity, blockers, and next decisions without reconstructing the company from disconnected updates.

THESIS

Foundation Data should operate internally the way Scout promises to help customers operate: trusted signals converted into prioritized action.

What the role must balance

SPEED VS TRUST

Move fast while preserving data confidence, explainability, evaluation, and customer credibility.

CUSTOM RESPONSIVENESS VS SCALE

Learn from customer needs without trapping technical teams in one-off delivery.

EXECUTIVE BREADTH VS OWNERSHIP

Extend leadership without becoming an approval bottleneck or shadow owner.

AI POSSIBILITY VS ECONOMICS

Measure released capacity, adoption, throughput, quality, and gross-profit leverage.

LIGHTWEIGHT VS LOOSE

Use the minimum mechanism that makes the decision clear.

The proposed operating system

INITIATIVE CONTRACT

- Customer or company decision improved.
- Economic load: revenue, margin, retention, capacity, risk, or leverage.
- Accountable owner and decision rights.
- Dependencies and capacity burden.
- Trust conditions and human authority.
- Leading evidence and next decision.

PORTFOLIO POSTURES

Accelerate, sequence, repair, or stop - based on evidence rather than advocacy.

CADENCE

A short weekly load review focused on changed evidence, aged blockers, cross-functional dependencies, forecast variance, and explicit decisions.

Questions and objection handling

QUESTIONS

- Which three outcomes matter most over the next 12 months?
- Where is expert capacity most trapped today?
- Which Scout use case has the strongest adoption and economic signal?
- What should this role decide independently after 90 days?
- What existing mechanism should be protected rather than replaced?

STRONGEST OBJECTION

My background crosses multiple industries rather than automotive-data SaaS alone. The advantage is a tested ability to learn operating context quickly, manage technical work without overclaiming engineering ownership, and build mechanisms across product, data, operations, quality, finance, and customer teams.

FIRST PROOF

Use a real initiative to demonstrate clearer ownership, dependency visibility, decision speed, and one measurable AI-enabled capacity release.
